

Statistics for the SDGs - indicators for national priorities

Name of the indicator	13.1.a Carbon dioxide (CO₂) emissions (2010=100)
Sustainable Development Goal	Goal 13. Climate action
Priority	Effective reduction of CO ₂ concentration in the atmosphere
Definition	Ratio of carbon dioxide emissions in the surveyed year to carbon dioxide emissions in 2010.
Unit	index: 2010=100
Available dimensions	total
Methodological explanations	<p>Air pollution means the introduction by human, directly or indirectly, into the air of solid, liquid or gaseous substances in such quantities as to endanger human health, adversely affect the climate, living nature, soil or water, or cause other damage to the environment.</p> <p>Greenhouse gases are components of the Earth's atmosphere, which due to their physicochemical properties have the ability to retain solar energy within the Earth's atmosphere, contributing to global warming. Greenhouse gases refer to carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O) and industrial gases: hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulfur hexafluoride (SF₆) and nitrogen trifluoride (NF₃). Greenhouse gases remain in the atmosphere for several years to thousands of years. They have an impact on the global climate, regardless of where they are emitted.</p> <p>The indicator is calculated excluding the balance of CO₂ emissions and removals from the LULUCF sector (land use, land use change and forestry) and including indirect CO₂ emissions.</p>
Data source	Institute of Environmental Protection - NRI National Administration of the Emissions Trading Scheme
Data availability	Annual data; since 2010
