

Statistics for the SDGs - global indicators

Goal	Goal 9. Industry, Innovation and Infrastructure'
Target in Si	9.4 By 2030, upgrade infrastructure and retrofit industries to make them sustainable, with ncreased resource-use efficiency and greater adoption of clean and environmentally sound technologies and industrial processes, with all countries taking action in accordance with their respective capabilities
Definition	The indicator determines the amount of carbon dioxide (CO2) in kg per one unit of gross value added of Gross Domestic Product (2010=100). The indicator CO2 emission per unit of value added is currently being measured by CO2 emission per GDP PPP Purchasing Power Parity).
Unit k	kg CO2 / 2010 USD PPP
Available dimensions to	otal
Methodological explanations Grant Boundary Commence of the co	Emission means the direct or indirect introduction, as a result of human activity, of the ollowing factors into the air, water, soil or land: a) substances, b) energies, such as heat, noise, vibration or electromagnetic fields. Gross value added (GVA) in the gross domestic product account, is the difference between gross output and intermediate consumption. GVA indicates the input of individual producers, industries and sectors to the GDP creation. Carbon dioxide (CO2) emission per unit of value added is a universal indicator for measuring the impact of industrial production on environment. It captures the intensity of energy use, energy efficiency of production technology and most importantly use of fossil usels.
Data source Ir	nternational Energy Agency
Data availability A	Annual data; since 2010.
